

# wood energy issues in Africa: some perspective and priorities

Jean-Noël Marien; Denis Gautier; Pierre Montagne; Régis Peltier

8th IAGE meeting – Bruxelles 13th december 2011

# Wood for energy A complex and evolving issue in Africa

# Fuelwood and charcoal in Africa

**The first source of domestic energy**

nearly 80 % of domestic energy supply, increasing

**A major component of forest degradation and deforestation**

more than 80% of total wood removal from forests, often related with agriculture

**An important source of revenues for poor and/or rural populations**

More important than formal wood industry in most countries

**A rapid evolution in all countries**

Consumption increase, resource depletes, costs increase

# No unique situation, but many gradients and local variations

From dry semi arid savanas to evergreen equatorial rainforests

From rural areas to big cities

From wood resource to markets and final consumers

By product of shifting agriculture or specific production for energy

Unformal (but very organized) supply chains adapted to local conditions

Various levels of consideration by politics and national institutions

# Some key data in Africa

	1970	2000	2030	
fuelwood	261	440	544	millions m <sup>3</sup>
charcoal	8	23	46	millions tons

Consumption wood energy  
wood energy / total energy

0,25 à 1 m<sup>3</sup>/hb/an  
70 à 95 %

Part of forest carbon release in central Africa: 80 %

One to ten times the quantity of commercial (formal and unformal) sawnwood production

# Main drivers of wood energy in Sub Sahara Africa

## Wood resource sustainability

Mostly from non managed forests and agriculture; more remote; resource scarcity increases

## Social issues for poor/rural populations

Only source of energy for most populations, with health and gender considerations

Adaptation of the supply to the consumption needs, but unsustainability

## Economic of informal supply chain, from forests to markets

Often more important than formal wood industry

Costs increase

## Institutional implication and governance

Low consideration on most legal frameworks

Relatively new question in central Africa

## Environmental impacts

degradation of most periurban and rural areas

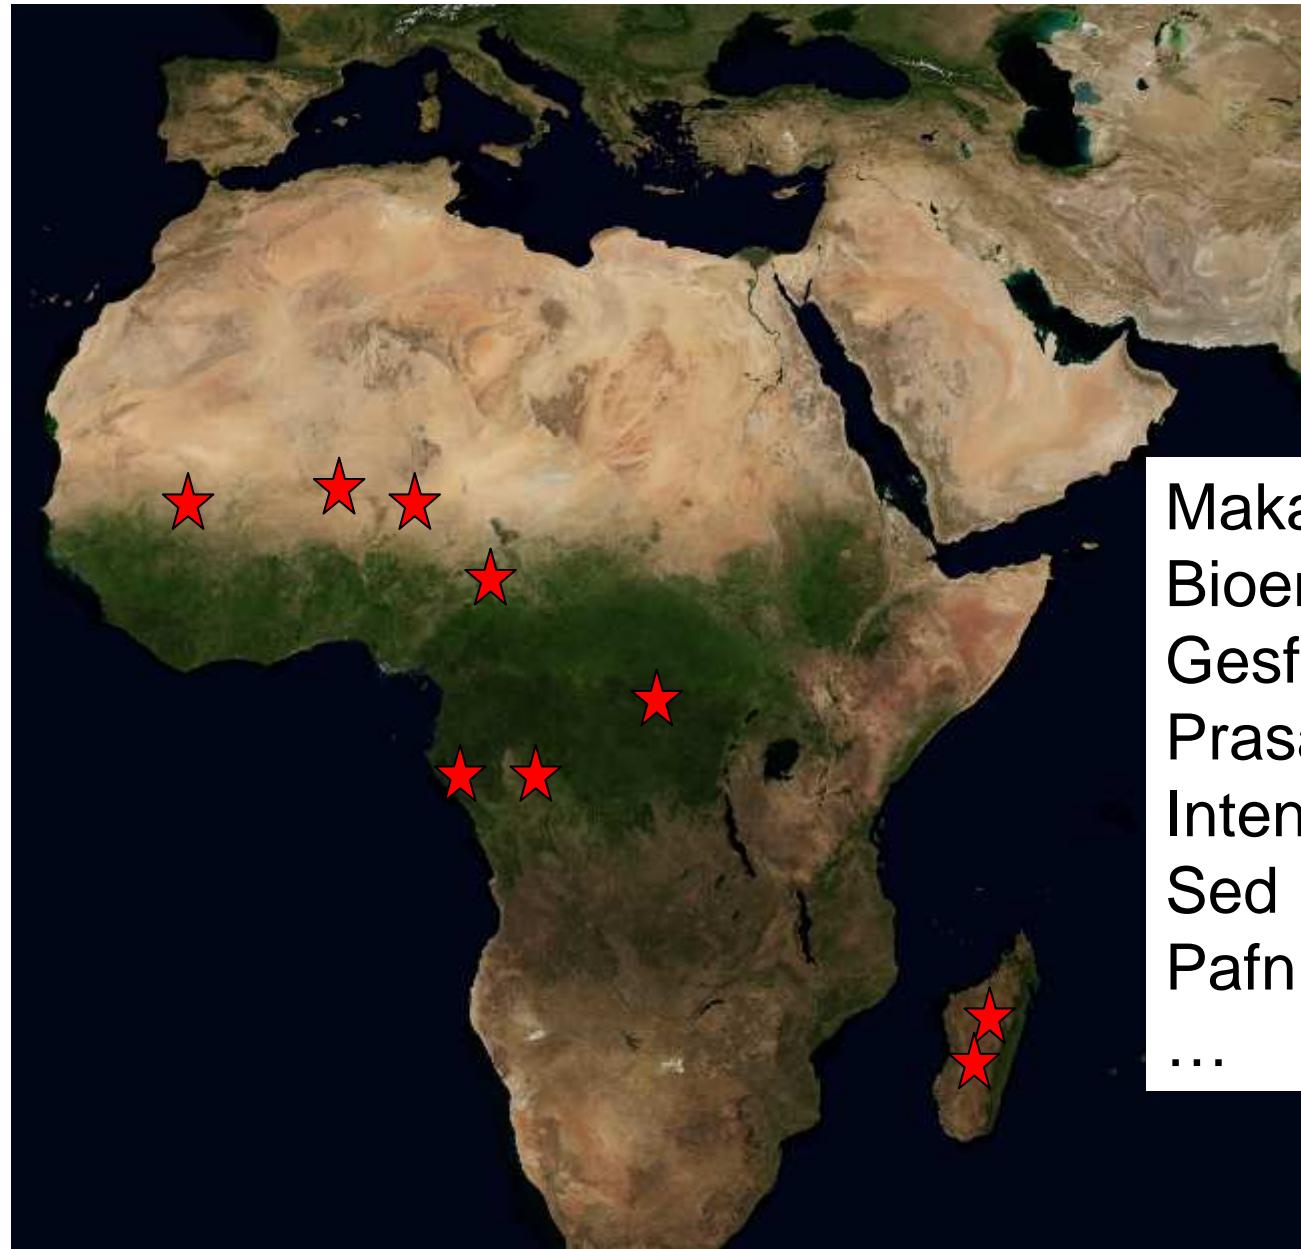

Potential important carbon issue (REDD)

Spatial and time scales

# Ongoing activities

# **Cirad involvement in wood energy issues in Africa**

## **Resource management**

Spatial and environmental impacts of increasing demand for cities  
Creation and/or sustainable management of wood resource

## **Supply chains**

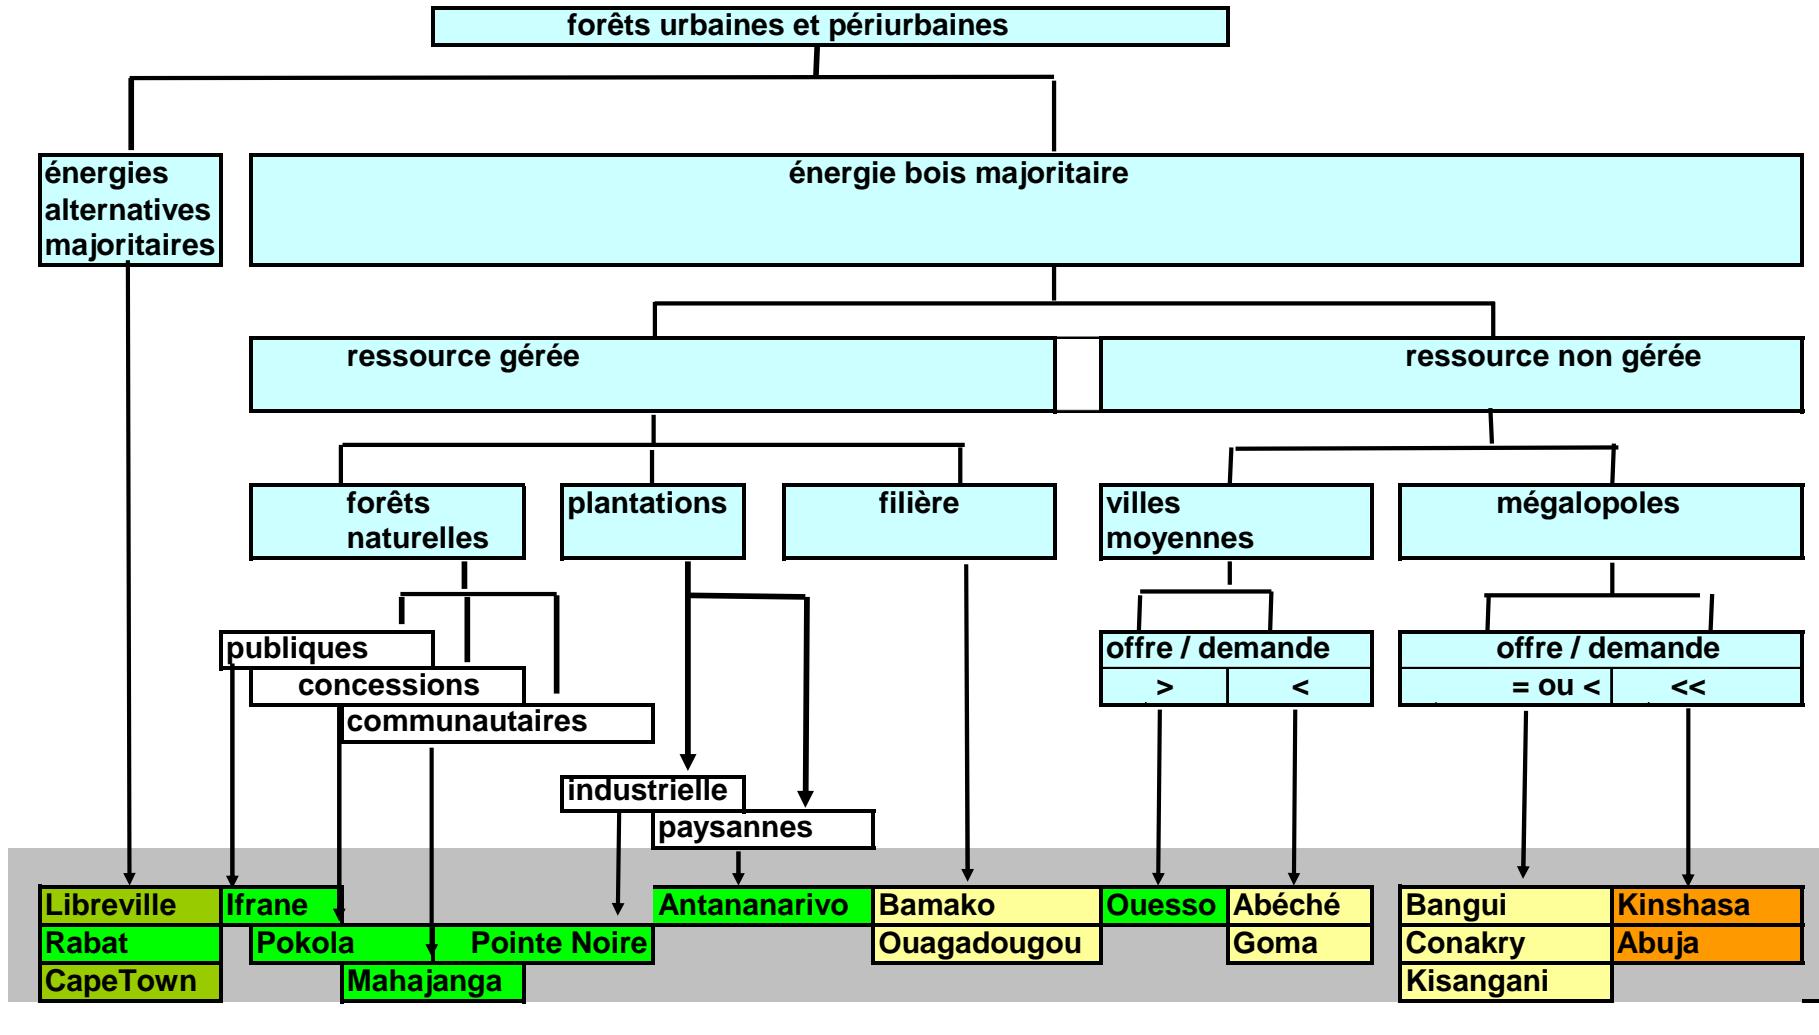

Supply chain organization through domestic energy strategies implementation and rural markets  
Social impacts of rural markets development  
Social and economics of supply chains

## **Institutions**

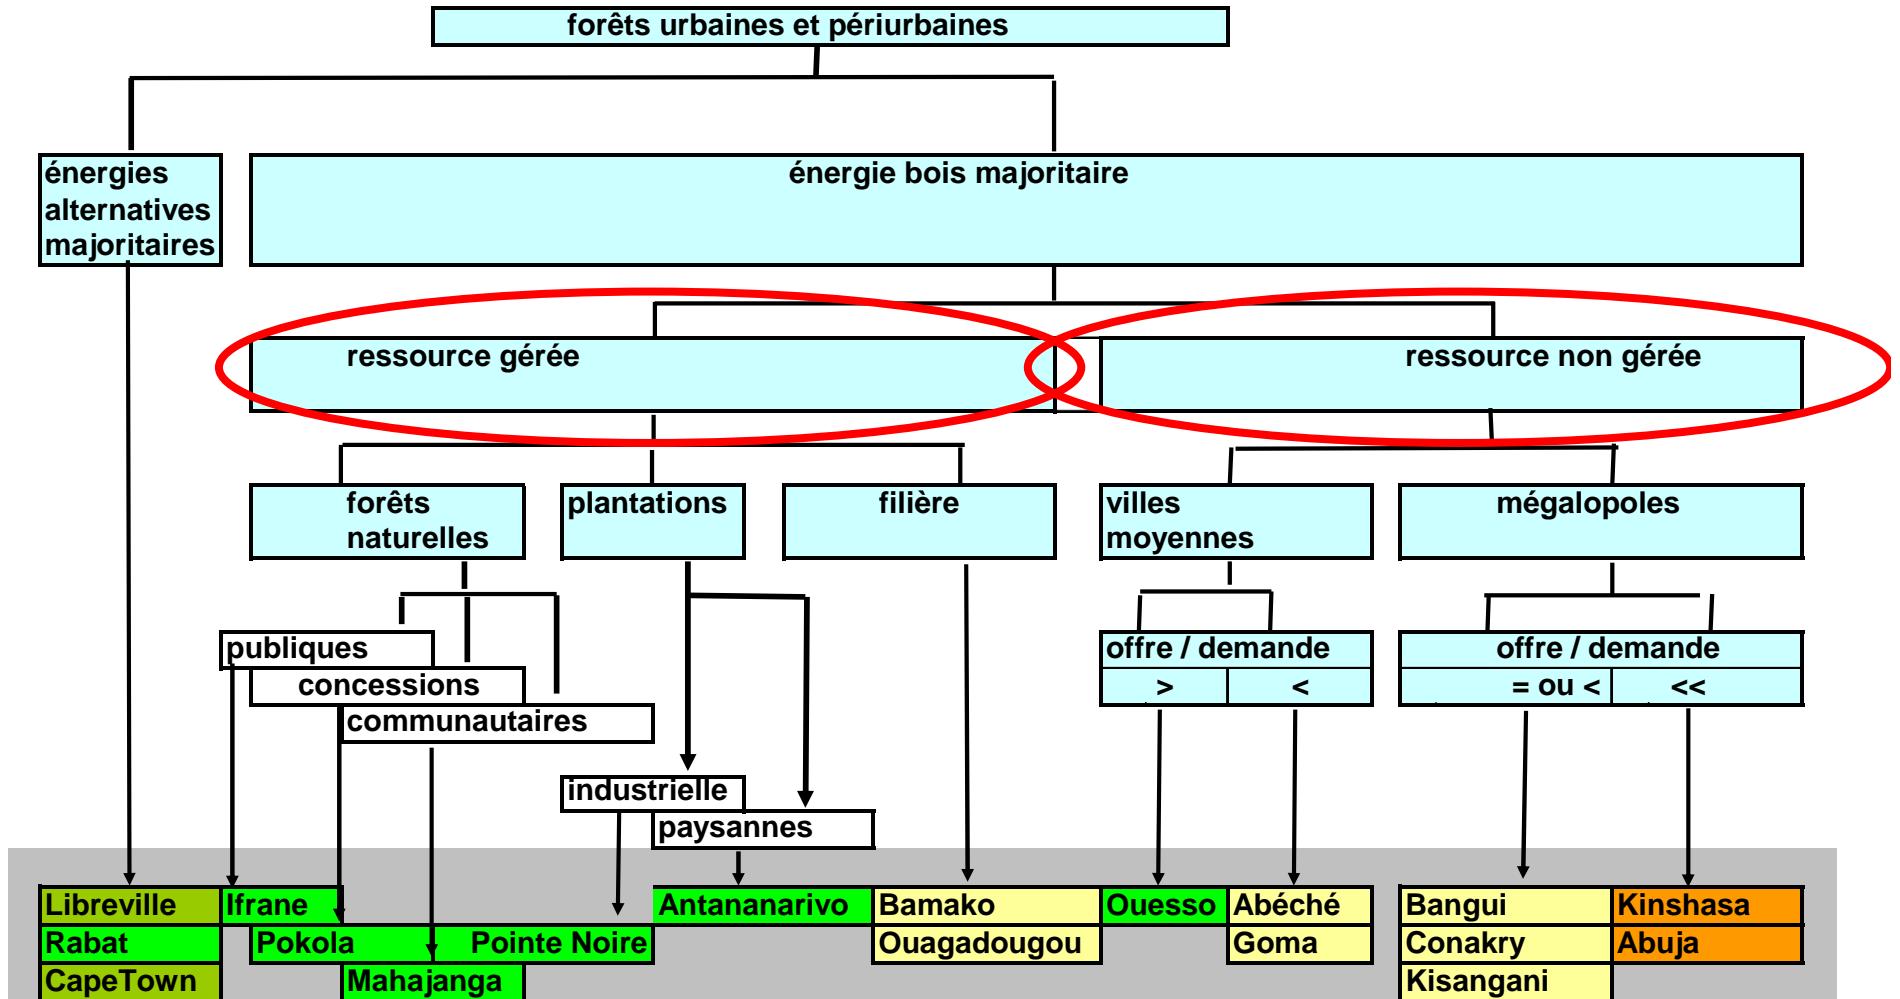

Impacts and dynamics of institutional changes in forestry regulations  
land tenure and territorial organizations to improve local appropriation and benefits  
Carbon economy; Redd+ and wood energy.

## **Improvement of wood energy**

Wood technology and quality for energy  
Rural power development using wood biomass

<span style="background-color: #80E6AA; border: 1px solid black; padding: 2px;"></span>	pression réduite, risque faible
<span style="background-color: #00FF00; border: 1px solid black; padding: 2px;"></span>	pression significative, mais contenue
<span style="background-color: #FFFF00; border: 1px solid black; padding: 2px;"></span>	dégradation significative, mais dans un périmètre restreint
<span style="background-color: #FF8C00; border: 1px solid black; padding: 2px;"></span>	dégradation accélérée et généralisée de la ressource

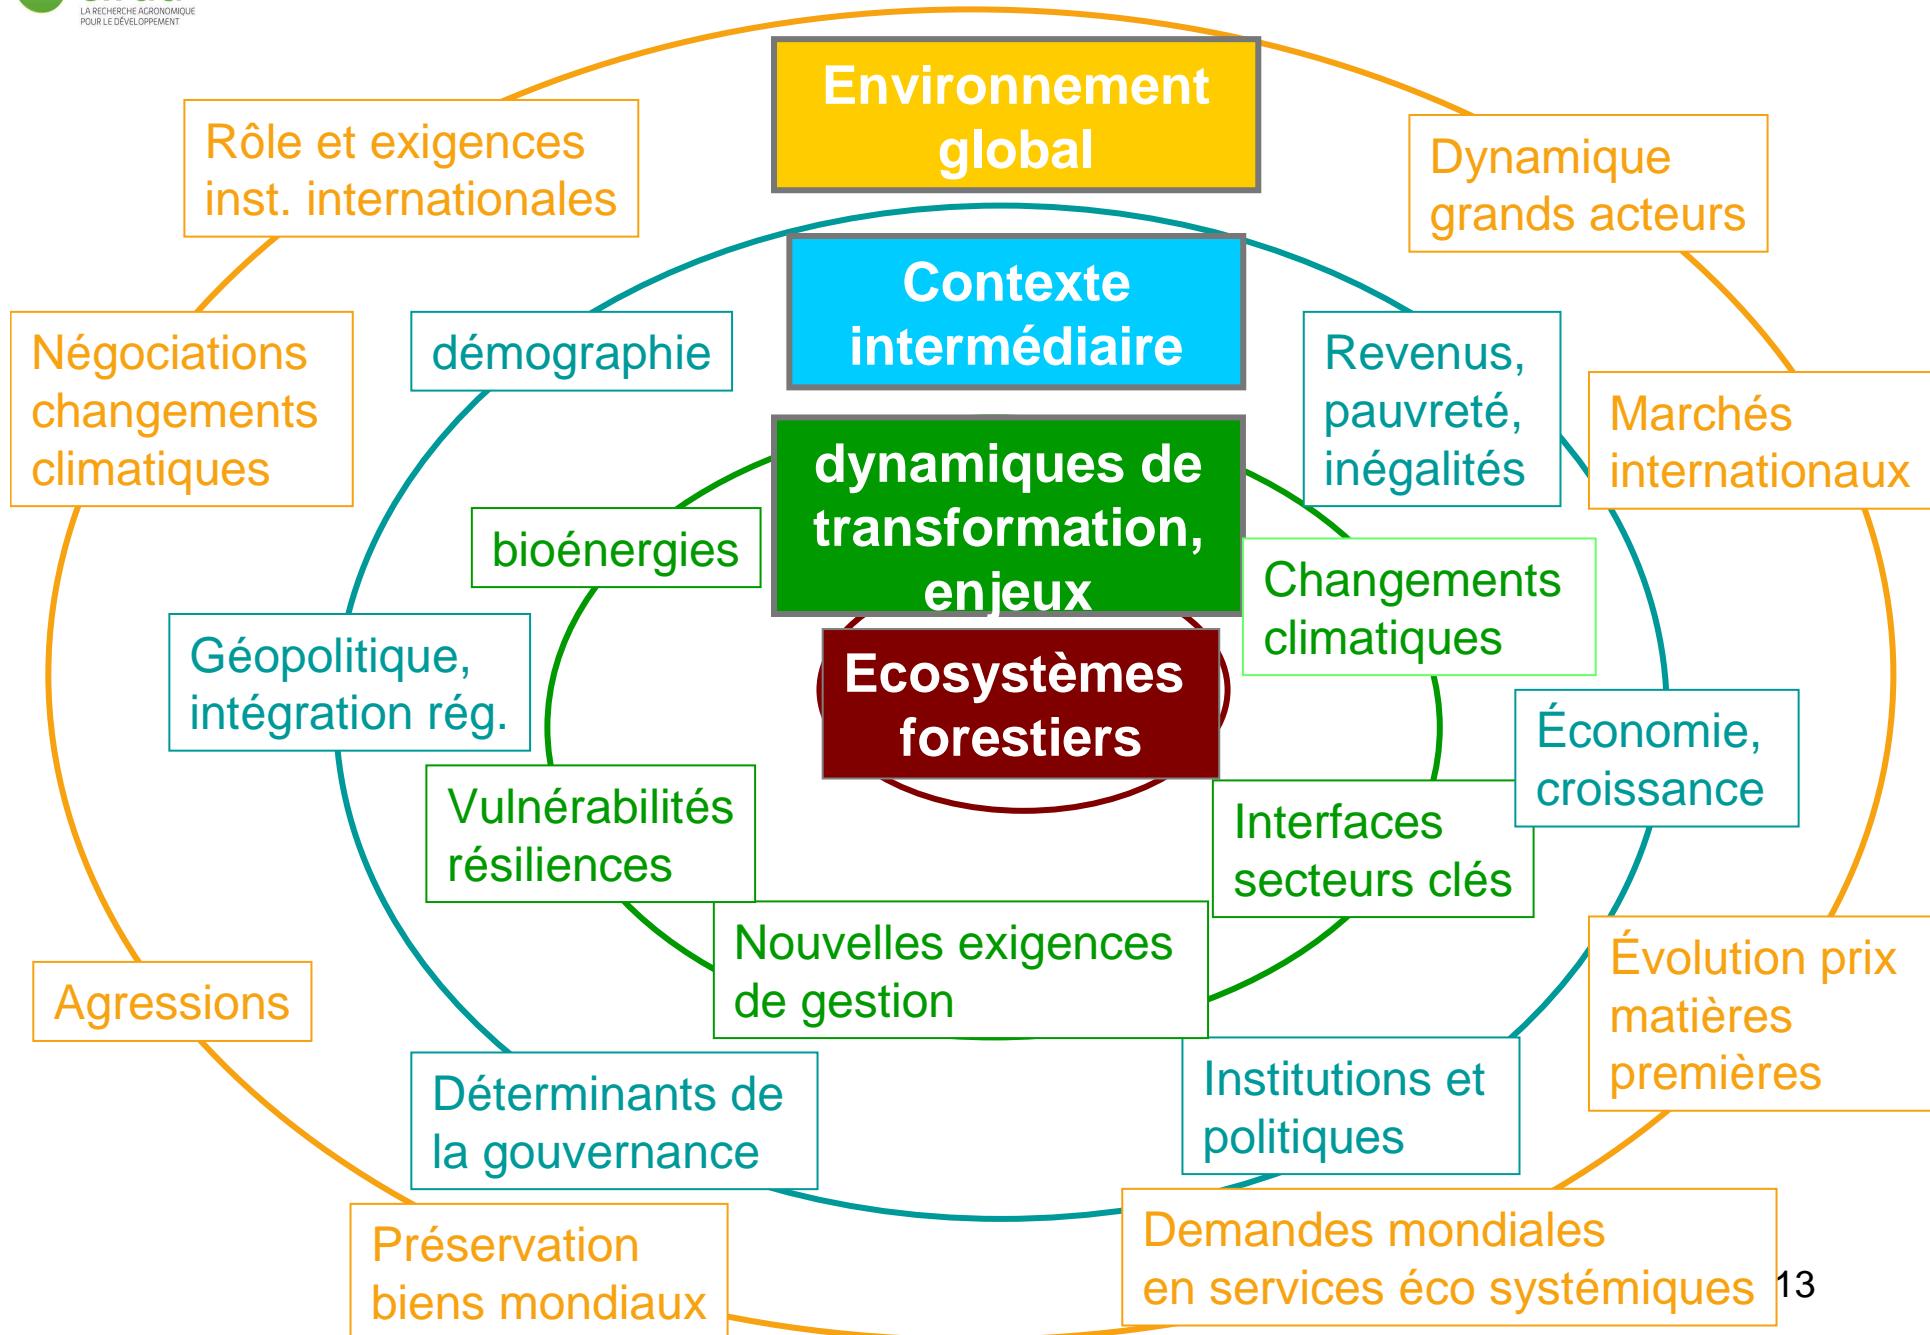

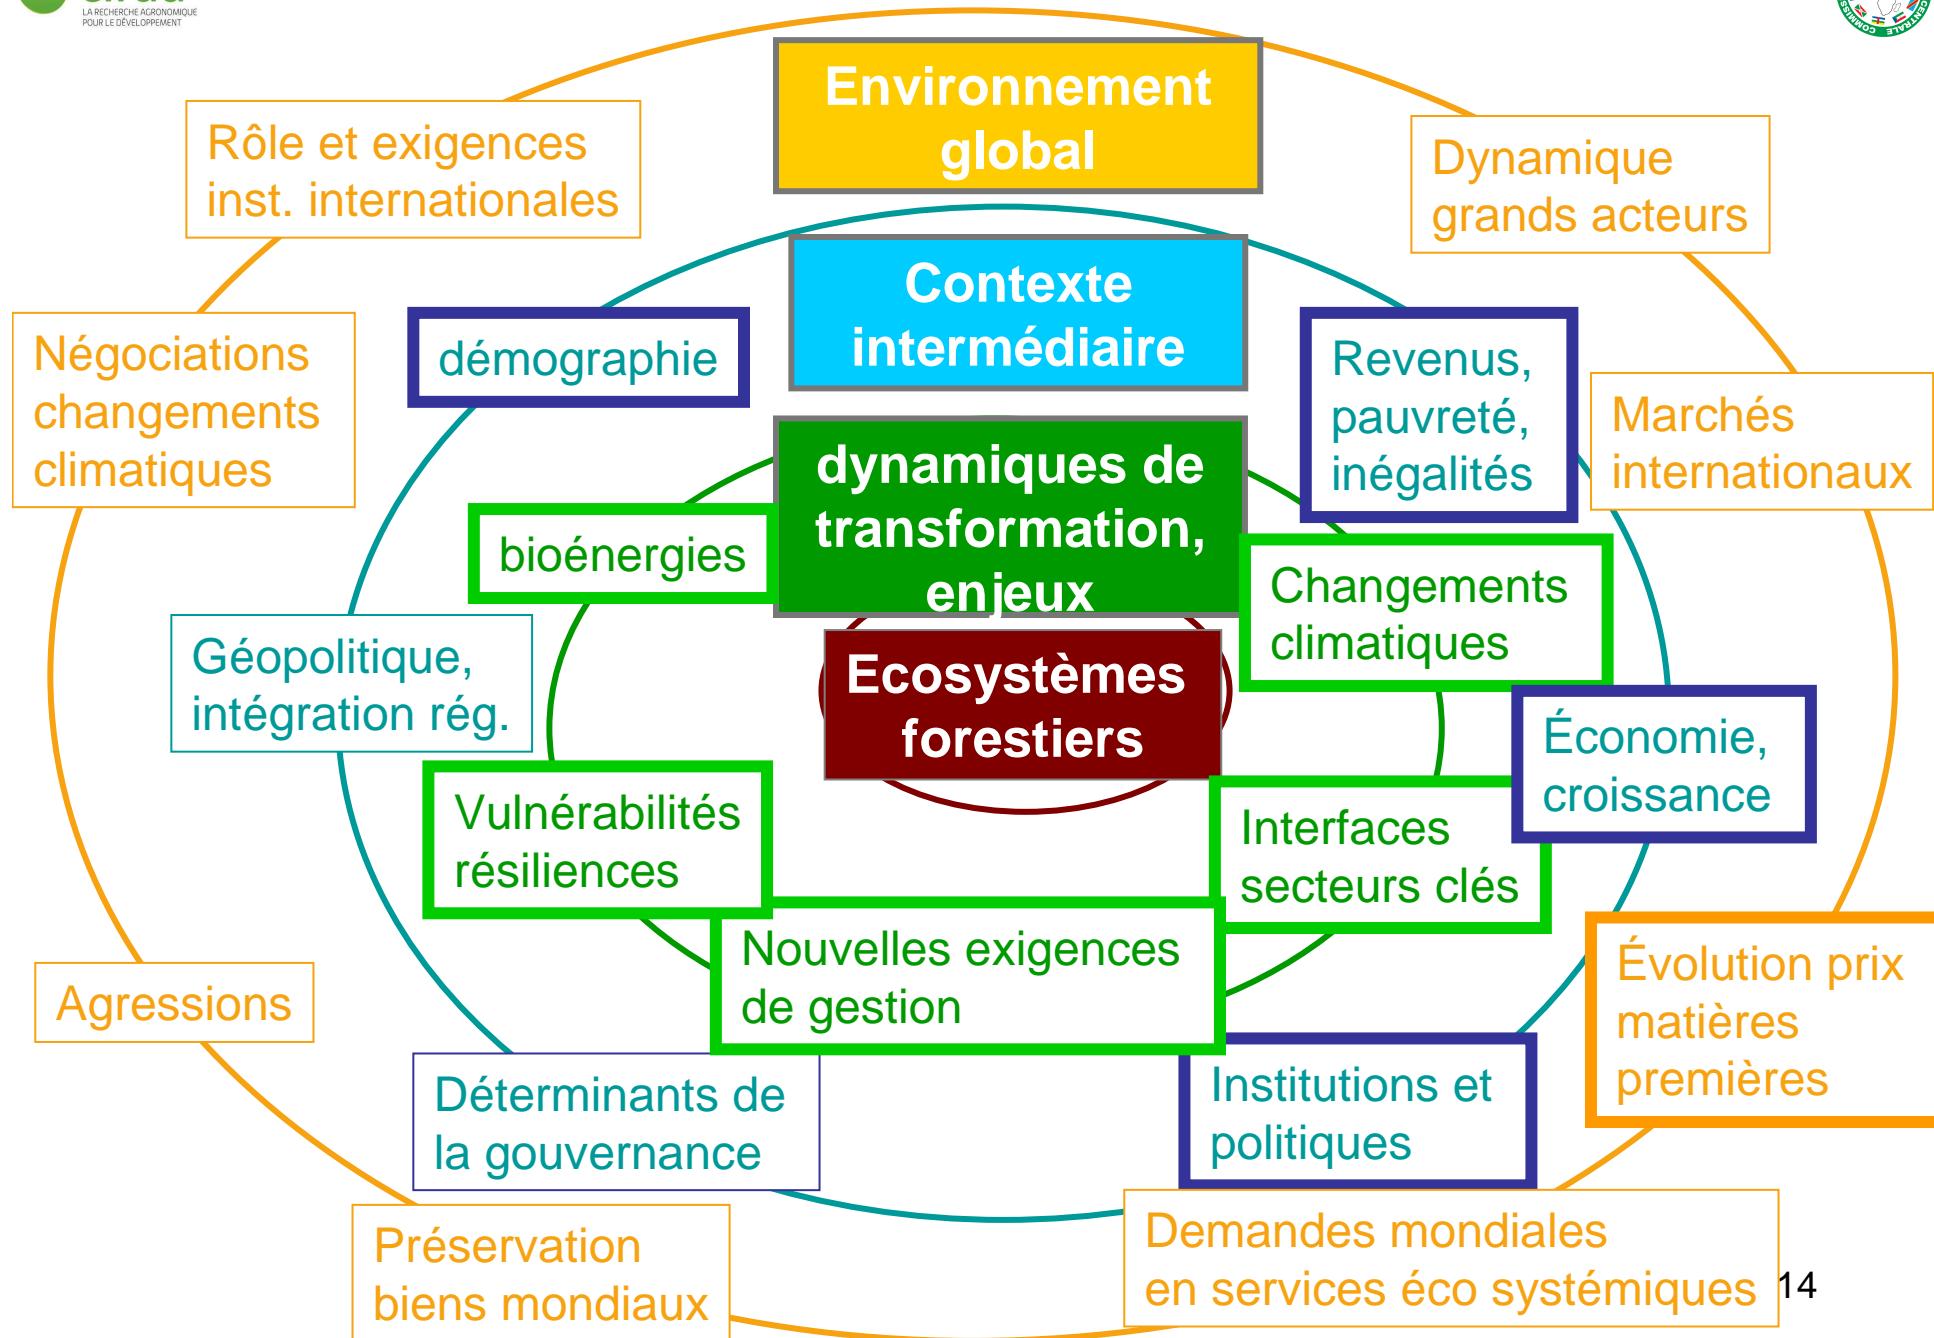

**The key level: wood resource availability and management**

pression réduite, risque faible
pression significative, mais contenue
dégradation significative, mais dans un périmètre restreint
dégradation accélérée et généralisée de la ressource

# Prospective analysis: Wood energy at the heart of future evolutions

# New questions, challenges and opportunities

# Wood for energy

Has long been considered as an energy for the poors and bad for environment

Is more and more actual as demography and urbanization increase

When properly and sustainably managed, must at the opposite be considered as a powerful tool against poverty, maintaining jobs and creating revenues in rural areas

Give value to low productivity or degraded forests instead of deforestation for agriculture

Management allows quick adaptation to climate change effects

Support local development though power plants using biomass

Agroforestry systems, with N fixing trees and improved fallows, allow sustainable wood production, agriculture and soils rehabilitation

# New challenges

## We can now share a global and coherent vision on wood energy issues

Availability and access to the resource, especially for the poorest (markets, cities..)

Secure supply in a context of expensive and/or rare and/or fossil alternative energy

Sustainable management of forests (created or natural)

Promote complementarity with small agriculture (agroforestry) and community management including energy

Increase energetic efficiency through resource quality and/or use (stoves,...)

Contribution to social welfare and economic development at family and local levels

Industrial uses of charcoal (power, cogeneration,...)

Second generation fuels

# **Some issues for further actions at resource and supply chain levels**

## **Define and implement adapted and efficient strategies**

Taxs, controls and regulations

Land use and rights

Territorial organization, management planning and stakeholders appropriation

Carbon related issues, LCA on the whole supply chain

Interface agriculture x forests and urban areas

Payment for environmental services

## **Increase and share knowledge**

Applied and operational research (social, economic, environment)

Learning and capacity building (academic and technicians)

Natural forests dynamics

## **Promote large scale operations**

Plantations, agroforestry, natural assisted regeneration

Valorize recent results (positive as negative)

Economic vision,

C&I sustainable management

# *Thank you for your attention*
